                                                                                                                                                                                                                                                                                                                                              Alignment
                                                                                                                                                                                                                                                                                                 Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the
                 Protease from S. Aureus
                                                                                                                                                                                                                                                                                     Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polynucleotide(s) and proteins derived stored on computer readable medium and anti-S.aureus vaccines

The DNA sequences were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.

The DNA sequences were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidylepetidase? (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. glugivitis or periodontitis). The present DNA sequence encodes the Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme of the invention.

The nucleic actids (I) may be used to produce the CC s. epidermidis polypeptides (II) via the production of vectors (II) cand/or nucleic actids) may then be ccontaining them which are used to produce hosts cells which express the CC polypeptides. The polypeptides (II) (and/or nucleic actids) may then be ccontained to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their catteriation of therefore identify compounds that may be used for the CC treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA CC polynucleotide sequences from the present invention. AAH55091 to CC AAH55090 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

CC N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, compared to the present specification of the present specification in the disclosure for SEQ ID NO:4454 so even the sequences are given in the disclosure for SEQ ID NO:4465 to 4472,

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infection particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472.

present sequence encodes an antigenic polypeptide fragment lated from Enterococcus faecalis. The present invention describes ries, proteins and antigenic polypeptides isolated from E. faecalis. proteins can be used in vaccines for preventing or attenuating an ection caused by a member of the Enterococcus genus in an animal. Year also be used for detecting Enterococcus antibodies in a samply can also be used for detecting Enterococcus antibodies in a samply can also be used for detecting Enterococcus antibodies.

                                                                                                      The present invention provides the protein and coding sequences of a number of polypeptides from Entercococcus faecalis. The proteins can be used as vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis. The polynucleotide is also useful for preventing or treating E. faecalis
                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis

The present invention describes genes, proteins can and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide

The present invention provides the protein and coding sequences of a number of polypeptides from Enterococcus faecalis. The proteins can be used as vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis. The polynucleotide is also useful for preventing or treating E. faecalis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New genes and polypeptides from Enterococcus faecalis, useful vaccines for preventing, treating or attenuating an infection a member of the Enterococcus genus in an animal, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel DNA array giving a representation of a number of Methylococous capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the

The products can be used to detect the presence of Enterococcus faecalls in samples. They can also be used for disposing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalls, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecals nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition (I) comprising: carriers CC and immunostimulants; and a polypeptide (II) of a ovarian tumour CC polypeptide encoded by a polynucleotide (II) having a cDNA sequence CC (S1) from the 10912 nucleotide sequences as given in ABL77023 to CC ABL87934, (III) encoding (II) having a sequence (S2), a T cell CC population of (II), or antigen presenting cells that express (II). CC (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises CC contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount of polynucleotide hybridising to (IV) and comparing the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising CC (III) and/or (II) is useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells contacting or (III) is useful for stimulating and/or expanding T cells contacting in tumour cells; and to isolate a full length gene from a cuttable library e.g., a tumour CDNA library using well known

the global expression of genes from FF cells allows the production competential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be considered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore compined to changes in culture conditions, environmental stress, spore compined to the stable of the composition of genes can be used to study how FF cells can compensate the control of cells and compensation of cells can compensation of the gene over genomic or can can compensate the control of the gene products to facilitate microarrays based on function of the gene products to facilitate can be used to the results, AAF11248 to AAF11247 represents ESTs from Aspergillus chiques AAF11854 to AAF11874 to AAF11873 represents ESTs from Aspergillus con control of the gene products to facilitate can be considered to AAF11875 to AAF11875 represents ESTs from Aspergillus con services and confidered to AAF11875 to AAF11875 to Trichoderma reesei, which are considered in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB seq

Patent No. 598555,

Patent No. 598555,

GENERAL INFORMATION:

APPLICANT: MCKENZIE, Ian F.C.

APPLICANT: HOGARPH, Mark P.

APPLICANT: SCOTT, Bernadette M.

APPLICANT: BONADONNA, Lisa

APPLICANT: HULETT, Mark D.

"TITLE OF INVENTION: FC RECEPTOR FOR IMMUNOGLOBULIN

"TITLE OF INVENTION: 7 RECEPTOR FOR IMMUNOGLOBULIN

"TITLE OF INVENTION: 7 RECEPTOR FOR IMMUNOGLOBULIN

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M University, College Station, Texas 77843-2123, USA using a HindIII

/note="Organ: embryo; Vector: pBluescript SK; Site_1: XhoI
: Site_2: EcoRI; Library was prepared by Statagene using
the Uni-ZAP XR system (Stratagene Bh937328-12). Clones
were picked by a Q-bot after blue/white selection
(ampicillin resistance - use 100 micrograms/microliter).
Developed from a pool of equal amounts of RNA from
developing embryos sampled at 14, 21, 28 and 35 days after
pollination of the Illnois High Oil Maize Strain Cycle
90. This closed strain has been selected for high oil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                walbot@stanford.edu

The sequence tag present in the cDNA between the NotI site and the Oligo-dT track served to identify it as a clone from the normalized adult 12-Day-Embryo library. cDNA Library Preparation: M. Fatima Bonaldo, Ph.D. Clone distribution: clones will be available through Research Genetics This clone is also available through the I.M.A.G.E. Consortium at LLNL (info@image.llnl.gov). IMAGE

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Novel isolated dipeptidylpeptidase useful for identifying inhibitor of the dipeptidylpeptidase for protecting an animal from periodontal disease caused by Porphyromonas gingivalis $\,$

```
The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a
                                                                                                                                                             Claim

                                                                                                   The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidylepetidase 7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents the
                                                                            or periodontitis).

the

The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents an active site region of the Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7)

Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide.

amino acid and coding sequence of the peptidylpeptidase-7 (DPP-7) enzyme. The

                                                                                                                                                                                                                                                                                                                                                                                                                          A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 molety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prodn. of recombinant polypeptide(s) - using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 molety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble protein the formation of the protein the formation of the protein bodies in E. coli.

The sequences given in AAR26842 and AAR29644 are proteases which was isolated from Staphylococcus aureus strains. The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 moiety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of the bost calls.
                                                                                                    Disclosure; Page 15-16;

                                                                                                            Fusion proteins (AAR91033 and AAR91034) were constructed comprising an Escherichia coli beta-galactosidase derivative (protective polypeptide) fused at its C-terminal end to the S. aureus mature V8 protease without or with the repeat region. The constructs were inserted into vector pG97S4DhCT(G)R6, yielding pV8RFT(-) and pV8RFT(+), respectively. Both constructs yielded active protease
                                                                                                                                                                                                       Prodn. of recombinant polypeptide(s) - using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide

                                                                                                                                                                                                                The invention relates to new mutant Staphylococcus aureus V8 proteases which have enzyme activity even under environmental conditions which protein denaturation. The mutants are based on 3 truncated V8 proteases lacking 48 (AAW22218), 56 (AAW22219) or 53 (AAW22220) amino acids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, N71S and/or R147K. The protein sequence shown here represents a chimaeric protein comprising a truncated Staphylococcus aureus V8 protease lacking the prepro and C-terminal 48 amino acids linked, via a synthetic linker, downstream of the E. coli beta-galactosidase. The S. aureus portion of the chimaera was amplified by the primers AAT/3254-5 from wild type sequence. The coding sequence was then used to generate mutants of the V8 protease which retain their levels of activity in the presence of a higher concentration of protein denaturant e.g. 5 M urea.

The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in

The constructs were inserted into vector pG9754DhCT(G)M6, Y1elding pV8RPT(-) and pV8RPT(-), respectively. Both constructs yielded active protease when expressed in E. coli JM101 transformants.

The fusion protein is expressed in inactive form in E. coli. It is then recovered, solubilised and cleaved at the linker peptide regions with a protease intrinsic to the host cells, i.e. ompT protease, to allow recovery of V8 protease.

                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to new mutant Staphylococcus aureus V8 proteases which have enzyme activity even under environmental conditions which promote protein denaturation. The mutants are based on 3 truncated V8 proteases lacking 48 (AAW22218), 56 (AAW22219) or 53 (AAW22220) amino caids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, N71S and/or R147K. The protein sequence shown here represents a chimaeric protein comprising a truncated Staphylococcus aureus V8 protease lacking the prepro and C-terminal 56 amino acids linked, via a synthetic R6 linker, CC downstream of the E. coli beta-galactosidase. Also included downstream of the V8 protease fragment is a second R6 linker and a fragment of the U8 protease fragment is a second R6 linker and a fragment of the S generated by restriction digestion and ligation from the V8RPT(-) sequence (see AAW22218) by using a natural EcoRV site which removed a further 8 amino acid from the C-terminus. This truncated V8 protease, designated V8D, retains its level of activity in the presence of a higher concentration of protein denaturant e.g. 5 M urea.
                                                                                                                                                                                                                                                                                                                                                                   Best Loc
